CONTRIBUTOR RECOGNITION PACKAGE

12 OCTOBER 2026

Aman Shandilya

PROJECT CONTRIBUTOR

This package recognises Aman Shandilya's contribution to **AION Bot**, Rajora AI's desktop-native AI agent that carries out operating-system tasks from natural-language instructions.

PROJECT

AION Bot

DESKTOP AI AGENT / NATURAL-LANGUAGE OS AUTOMATION

ROLE	DOCUMENT REFERENCE	DATE OF ISSUE

RAJORA AI / CONTRIBUTOR RECOGNITION

CERTIFICATE OF

PROJECT CONTRIBUTION

PRESENTED TO

Aman Shandilya

PROJECT CONTRIBUTOR

In recognition of Aman's contribution to the **AION Bot** project at Rajora AI, a desktop AI agent designed to coordinate operating-system tasks from natural-language instructions.

PROJECT

AION Bot

Desktop AI agent / natural-language OS automation

Letter of Recommendation

To Whom It May Concern,

This letter confirms that **Aman Shandilya** has contributed to the **AION Bot** project at Rajora AI as a **Project Contributor**.

AION Bot is a desktop-native AI agent designed to translate natural-language instructions into multi-step operating-system tasks. Its documented architecture connects a Tauri desktop shell and a Next.js web dashboard to a FastAPI backend and a LangGraph-based agent workflow.

The project documentation describes a tool layer for browser automation, desktop control and GitHub operations, together with policy checks for sensitive actions and a Docker-isolated shell execution environment. It also documents real-time task-progress updates, a Model Context Protocol (MCP) interface, and routing across supported hosted and local language models.

We appreciate Aman's contribution to this engineering initiative and are pleased to recommend Aman for opportunities aligned with AI and software engineering, with best wishes for continued learning, professional growth and success in the journey ahead.

This letter can be verified by writing to hello@rajora.live and quoting reference **RA-CR-2026-1012-AMS01**.

Sincerely,

Er. Rajeev Rajora
Founder & Principal Architect
Rajora AI

PROJECT PROFILE / OVERVIEW & ARCHITECTURE

12 OCTOBER 2026

AION Bot

DESKTOP AI AGENT / NATURAL-LANGUAGE OS AUTOMATION

AION Bot is a desktop-native AI agent that carries out operating-system tasks from natural-language instructions. A Tauri shell and a Next.js dashboard talk to a FastAPI backend, which runs every request through a stateful LangGraph agent that plans, acts through controlled tools and streams its progress back in real time.

WEBSITE aion.bot.rajora.live

KEY CAPABILITIES

NATURAL-LANGUAGE CONTROL

Describe a task in plain English; the agent plans it and executes it step by step.

STATEFUL AGENT

Replans on tool failure without restarting; tasks can be cancelled and resumed from a checkpoint.

BROWSER AUTOMATION

Playwright-driven, selector-based actions that survive layout changes and DPI scaling.

DESKTOP CONTROL

OS-level keyboard, mouse and window actions, held behind a policy gate.

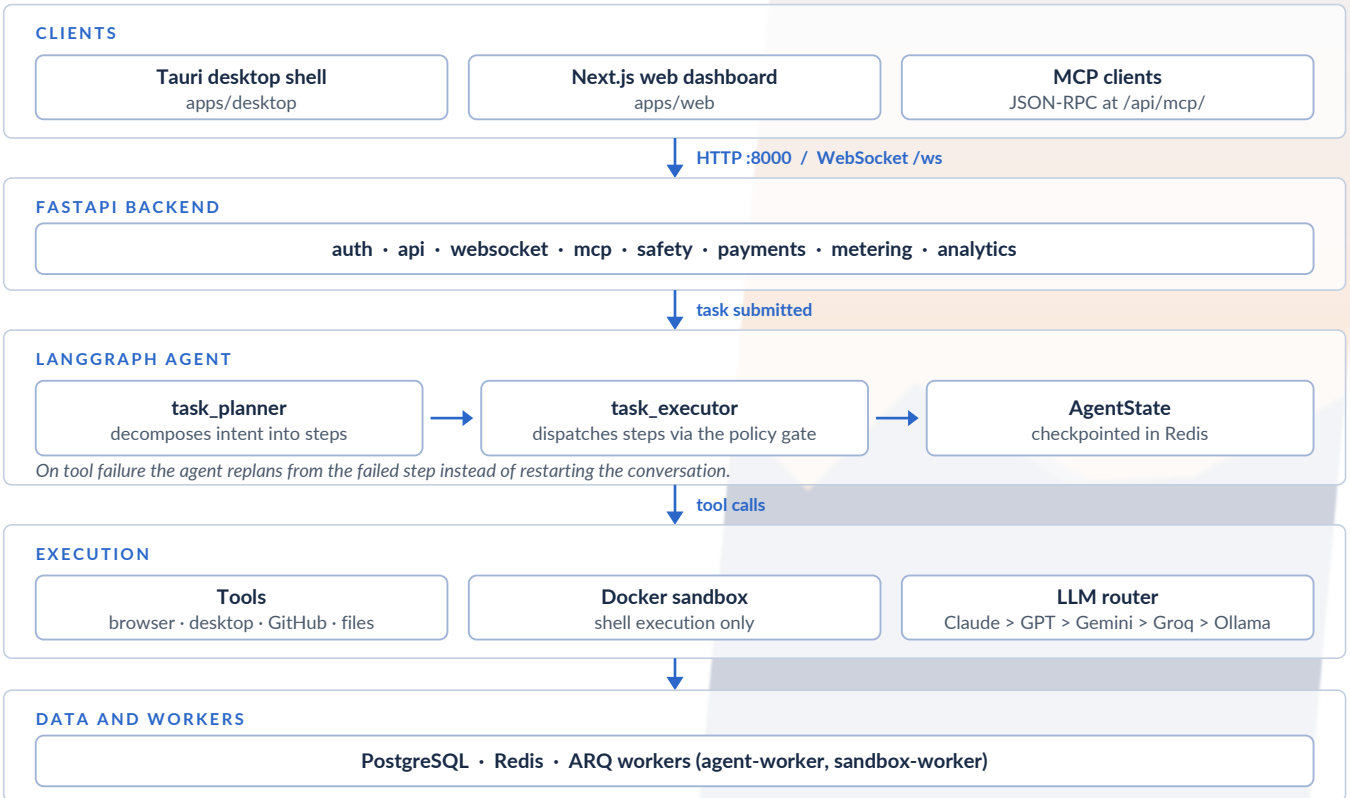

GITHUB AND PLUGINS

GitHub operations plus OAuth plugins for Gmail, Drive, Calendar, Slack and Notion.

MCP AND MULTI-LLM

MCP server and client; routing across Claude, GPT, Gemini, Groq and local Ollama.

SYSTEM ARCHITECTURE

PROJECT PROFILE / DESIGN & SAFETY

12 OCTOBER 2026

Design & Safety

HOW AION BOT STAYS IN CONTROL OF A REAL MACHINE

SAFETY MODEL

POLICY ENGINE

Deny-by-default. Risky actions such as hotkeys, form submits and JS evaluation wait for explicit user confirmation.

DOCKER SANDBOX

All shell execution runs in disposable containers with deny-by-default networking. No host-shell fallback.

INPUT SAFETY

Layered input checks with audit logging.

REDACTION

Secrets are redacted in logs and in deliverable manifests.

KEY VAULT

Bring-your-own LLM keys are AES-encrypted in PostgreSQL and decrypted only at request time.

AUTH AND LIMITS

JWT with refresh-token rotation, plus a per-user cap on concurrent tasks.

TECHNOLOGY STACK

LAYER	TECHNOLOGY	WHY THIS CHOICE
Desktop shell	Tauri (Rust)	Small native binary; Rust memory safety in the native layer
Backend	FastAPI, Python 3.11	Async-native; Pydantic v2; HTTP and WebSocket on one port
Agent graph	LangGraph	Stateful loops with conditional edges and checkpointing
Browser automation	Playwright	Selector-based and cross-platform
Desktop control	PyAutoGUI	OS-level input, kept behind the policy engine
Data and state	PostgreSQL, Redis, ARQ	Async persistence, agent state and background workers
Auth and keys	JWT (HS256), AES vault	Per-user LLM keys encrypted at rest

KEY DESIGN DECISIONS

TAURI OVER ELECTRON

A far smaller binary, and the Rust process boundary means a WebView crash cannot corrupt backend state.

LANGGRAPH OVER RAW CHAINS

Conditional edges and checkpointed state: a failed call retries from the failed node, and tasks can be cancelled and resumed.

PLAYWRIGHT, THEN PYAUTOGUI

Selector targeting survives layout changes; PyAutoGUI is reserved for OS-level control behind the policy engine.

SHELL ONLY INSIDE DOCKER

Disposable containers with per-task workspaces make queued and remote production deployment safe.

DEPLOYMENT AND OPERATIONS

DOCKER COMPOSE

PostgreSQL, Redis, backend, agent-worker and nginx, plus a separate isolated sandbox worker.

OBSERVABILITY

Kubernetes manifests, Prometheus rules, a Grafana dashboard and a token-protected /metrics endpoint.

CI/CD

Tests, Trivy container scans and image builds on every push to main; deploys on version tags.
